

COMPANY PROFILE

INCLUDIS GmbH
Rosenstr. 2
GER-10718 Berlin

Tel. +49 (0) 30 200 89 69 – 0
Fax +49 (0) 30 200 89 69 – 22

Email: mail@includis.com
Internet: www.includis.com

Founding year: 1995
Management:
Dipl.-Ing. Jochen Brinkmann

In the MES (Manufacturing Execution Systems) market segment, INCLUDIS develops and distributes technologically leading, highly automated standard software solutions for information management in production. In the area of the vertical integration of production and process data, new standards are established with INCLUDIS, the product line of the same name.

Transparency in production

The constant exchange of information between production and administration with enquiries on the current state of orders, date of delivery and availability of operating means are part and parcel of the day-to-day business of every producing company. The faster current information is provided, the better the planning quality throughout the entire company.

This is where INCLUDIS software solutions will be applied which provide for reliable real-time information on production sequences.

Customer benefit

With INCLUDIS you obtain transparent production sequences within a short time, constant production monitoring (24/7) combined with an automated alarm system, and reliable key data on effectiveness (overall equipment effectiveness) (O.E.E.)

Improved use is made of available resources, and clear savings potentials are achieved. Additionally, deliveries on schedule and reductions of start-up times are measurable results.

Experience from numerous customer installations in Germany and abroad shows that Return on Investment (ROI) can already be realized after 6 – 9 months.

Range of services

With the help of INCLUDIS, the central link between ERP/PPS systems and machines,

- machine / operating data
- process / quality data
- operating means and material data
- order and storage movements

are recorded in real-time, processed, and evaluated.

Data are recorded on the basis of industrial standards. Depending on requirements, industrial field bus systems, mobile barcode readers, or pocket and/or industrial PCs are used. Optionally, a web-based software solution is available with INCLUDIS.mdc, which integrates machines and equipment in existing IT system environments and visualizes them via webbrowser.

Production Scheduling

The Concept

INCLUDIS software solutions have a lean structure and avoid overlapping to ERP systems. They can be quickly installed and are easy to operate. Data are collected through industrial standards which are the state-of-the-art in information technology (TCP/IP / WLAN).

INCLUDIS focuses on a high degree of automation that saves hardware costs and minimizes the manual data collection effort.

The integrated distribution of information via messenger guarantees an Automated Reporting System and places the relevant production information via e-mail/SMS at users' disposal.
